

Basket cleaning systems

Tasks

After each coating process, basket cleaning systems remove coating medium from baskets, thereby preventing media from being mixed. In addition, basket cleaning makes sandblasting unnecessary.

Principle of operation

Baskets are placed into basket washing systems via lifting trolleys. There, they are turned upside down and washed down from the inside as well as from the outside with a very high-pressure water spray system with no addition of chemicals.

Basket cleaning systems are very environmentally friendly and achieve perfect cleaning results.

Advantages

- No basket incrustation
- Mixing of parts is prevented since washing is performed before each re-filling
- No use of chemicals
- Much longer service life of the baskets
- Baskets always remain in the centrifuge system

Examples of use

- Re-sealing systems
- Anti-friction coating systems
- Lacquering systems
